**PATENT** 

**DOCKET NO.:** CC-3628/A0363US3

Application No.: 10/773,641

Office Action Dated: October 12, 2004

This listing of claims will replace all prior versions, and listings, of claims in the application.

## **Listing of Claims:**

1. (previously presented) A system for detecting a lining of a container closure that includes a panel having a lining formed thereon, said system comprising: a conveyor for moving said plural closures longitudinally therealong, said conveyor having a conveying surface that supports an outside surface of said closures;

a color sensor that senses said panel of each one of said closures on said conveyor for a predetermined color, said color sensor being capable of identifying a sufficient color status that corresponds to a sufficient lining and a deficient color status that corresponds to an insufficient lining; and

a separator capable of removing from said conveyor closures having a deficient color status, whereby said system automatically identifies and removes said closures that have said deficient color from the conveyor.

- 2. (original) The system of claim 1 further comprising an oven for baking said lining, said conveyor moving said closures into said oven.
- 3. (currently amended) The system of elaim 1 claim 36 further comprising a compound machine that sprays a compound the lining compound on said panel, said lining compound forming said lining a cured lining after curing, said color sensor disposed between said compound machine and an oven said oven.
- 4. (currently amended) The system of claim 3 wherein said <u>lining</u> compound comprises a plastisol.
- 5. (original) The system of claim 4 wherein said closures are heated in said oven to cure said plastisol.
- 6. (original) The system of claim 5 wherein said oven heats said closures to approximately 380 degrees to 400 degrees Fahrenheit.

**DOCKET NO.:** CC-3628/A0363US3

Application No.: 10/773,641

Office Action Dated: October 12, 2004

7. (original) The system of claim 1 wherein said color sensor senses a predetermined wavelength of light to identify the sufficient color status.

- 8. (original) The system of claim 1 wherein the separator comprises a compressed air jet that blows said closures having the deficient color status from said conveyor.
- (original) The system of claim 1 wherein said color sensor is directed to said conveyor surface.

## 10-33. (canceled)

- 34. (previously presented) The system of claim 1 wherein said color sensor is capable of sensing a predetermined wavelength of light to identify the sufficient color status.
- 35. (previously presented) The system of claim 1 wherein the closure is unitary such that the panel is unitarily formed with a skirt.
- 36. (new) A system for detecting a lining compound of a container closure that includes a panel having a lining compound thereon, said system comprising:
- a conveyor for moving said plural closures longitudinally therealong, said conveyor having a conveying surface that supports an outside surface of said closures;
- a color sensor that senses said panel of each one of said closures on said conveyor for a predetermined color, said color sensor being capable of identifying a sufficient color status that corresponds to a sufficient lining compound and a deficient color status that corresponds to an insufficient lining compound; and
- a separator capable of removing from said conveyor closures having a deficient color status, whereby said system automatically identifies and removes said closures that have said deficient color from the conveyor.

**DOCKET NO.:** CC-3628/A0363US3

**Application No.:** 10/773,641

Office Action Dated: October 12, 2004

37. (new) The system of claim 3 wherein said color sensor senses a predetermined wavelength of light to identify the sufficient color status.

- 38. (new) The system of claim 3 wherein the separator comprises a compressed air jet that blows said closures having the deficient color status from said conveyor.
- 39. (new) The system of claim 3 wherein said color sensor is directed to said conveyor surface.
- 40. (new) The system of claim 3 wherein said color sensor is capable of sensing a predetermined wavelength of light to identify the sufficient color status.
- 41. (new) The system of claim 3 wherein the closure is unitary such that the panel is unitarily formed with a skirt.
- 42. (new) The system of claim 2 wherein said lining comprises a plastisol.
- 43. (new) The system of claim 42 wherein said closures are heated in said oven to cure said plastisol.
- 44. (new) The system of claim 43 wherein said oven heats said closures to approximately 380 degrees to 400 degrees Fahrenheit.
